Abstract: A synopsis of the sect. *Hymenocoleus* Bunge, sect. *Hymenostegis* Bunge, and sect. *Macrophyllum* Boiss. belonging to *Astragalus* L. in Turkey is given based on a revisional study carried out in Turkey. As a result of this study, an account of 19 species including keys and general distribution as well as their conservation status in Turkey is given. It is determined that *A. narmanicus* Karaman & Aytaç is new to science and *A. expetitus* Maassoumi, *A. pereshkhoranicus* Maassoumi & F.Ghahrem., and *A. marivanensis* Maassoumi & Podlech do not exist in Turkey. Additionally, the name of the sect. *Hymenocoleus* is preserved.

Key words: *Astragalus*, section, conspectus, Turkey

1. Introduction

The genus *Astragalus* L. (Fabaceae) has approximately 3000 taxa around the world. The genus is known to spread vigorously in cold, semiarid, and arid regions of the Old World (approximately 2400 species); in western regions of North America (about 450 species); and especially along the Andean Mountains in South America (about 100 species) (Maassoumi, 1998; Podlech and Zarre, 2013).

Astragalus section *Hymenostegis* was first named by Bunge (1868–1869) in his revision, entitled “Generis Astragali species gerontogae” under the subgenus *Calyphysa*. This section was revised by Rechinger et al. (1958) and then was included in the *Flora of Turkey* (Chamberlain and Matthews, 1970), *Flora of USSR* (Gontscharov, 1946) and *Flora of Iraq* (Townsend and Guest, 1974). The latest revision of the section was made by Zarre and Podlech (1996). *Astragalus* section *Macrophyllum* Boiss. was described first by Boissier (1872).

Species assigned to the section *Hymenostegis* Bunge are spread throughout western Asia. The origin and the diversification center of this section are in Iran. The section is represented by 12 species (*A. uraniolimneus* Boiss. has been recorded as a doubtful species) in the *Flora of Turkey* volume 3 (Chamberlain and Matthews, 1970) and one extra species in volume 11 (Aytaç, 2000), a total of 13 species, four of which are endemic. In 2008, *A. expetitus* Maassoumi was published as a new record for Turkey by

Podlech and Ekici (2008). According to Podlech and Zarre (2013), there are 54 species of sect. *Hymenostegis* in Iran, 14 in Turkey (including two endemics), three in Armenia, three in Azerbaijan, three in Iraq, and one in Georgia.

The number of species assigned to *A. sect. Macrophyllum* in the flora of Turkey was thought to be nine, five of them being endemic (Chamberlain and Matthews, 1970). However, Zarre (2000) reduced the number of species in Turkey to five and the number of endemic species to one. Karaman and Aytaç (2013) published *A. yukselii* Karaman & Aytaç within the sect. *Macrophyllum* and increased the number of species to six, two of which are endemic to Turkey.

The main objectives of this study were to clarify the taxonomic status of species belonging to *Astragalus* sect. *Hymenocoleus* Bunge, *A. sect. Hymenostegis* Bunge and *A. sect. Macrophyllum* Boiss. in Turkey based on field studies and herbarium surveys, and provide their emended descriptions, distributions, and ecology.

2. Materials and methods

Since 2011, as part of a revision of the genus *Astragalus*, extensive field surveys were conducted in Turkey and a large number of specimens were collected. The specimens were all cross-checked with the various *Astragalus* accounts given in the relevant literature: *Flora Uzbekistana* (Borissova, 1955), *Flora Tadzhikistana* (Borissova, 1937), *Flora USSR* (Borissova, 1946), *Flora Kavkaza* (Grossheim,

* Correspondence: seherkaraman@yahoo.com

1952), *Flora Europaea* (Chater, 1968), *Flora of Turkey* (Chamberlain and Matthews, 1970; Aytaç, 2000), *Flora Azerbaijanica* (Rzazade, 1954), *Flora of Iraq* (Townsend, 1974), *Flora Palaestina* (Zohary, 1987), *Flora of Iran* (Maassoumi, 2003), and other relevant literature (e.g., Yakovlev et al., 1996; Zarre and Podlech, 1996; Maassoumi, 1998; Zarre, 2000; Podlech and Zarre, 2013). The section keys were based on the work by Podlech and Zarre (2013), the authors' own samples, and examined specimens in both domestic (ANK, GAZI, HUB, KNYA, and VANF) and foreign herbaria (MSB, E, K, and G). Author abbreviations were given according to Brummitt and Powell (1992) and herbaria acronyms were given according to *Index Herbariorum* (Thiers, 2015). The conservation status was assessed according to the IUCN (2014). The examined specimens are listed in the Appendix. The species are given in alphabetical order in the article and Appendix.

3. Results and discussion

3.1. *Astragalus* L. sect. *Hymenocoleus* Bunge, Mém. Acad. Imp. Sci. Saint Pétersbourg 11(16): 57. 1868. **nom. cons.**

Type (monotypic): *A. vaginans* DC., Astragal.: 210. 1802.

≡ *Astragalus* sect. *Hymenostegis* subsect. *Hymenocoleus* (Bunge) Podlech & Zarre, Sendtnera 3: 261. 1996. **nom. rej.**

Astragalus sections *Hymenostegis* and *Hymenocoleus* were recognized as two different sections in the *Flora of Turkey* (Chamberlain and Matthews, 1970). *Astragalus vaginans* as the only member of the sect. *Hymenocoleus* is separated from the sect. *Hymenostegis* by imparipinnate (not paripinnate) leaves and forming wide cushions (Chamberlain and Matthews, 1970). However, the section *Hymenocoleus* was reduced to the rank of subsection. Moreover, *A. vaginans* is characterized by stems 30–50 cm long, internodes 1–1.5 cm long, and imparipinnate leaves (Zarre and Podlech, 1996). As a result of our field work and specimen examinations, we agree with the previous literature (Maassoumi, 1995; Podlech et al., 2001; Bagheri et al., 2011; Podlech and Zarre, 2013) in contrast to Zarre and Podlech (1996) and we decided to keep *Hymenocoleus* at sectional level.

3.2. *Astragalus* L. sect. *Hymenostegis* Bunge, Mém. Acad. Imp. Sci. Saint Pétersbourg 11(16): 66. 1868.

Güzeldere pass in Van (Turkey) Province is an important diversity center for *Astragalus* sect. *Hymenostegis*. It is possible to find *A. uraniolimneus* Boiss., *A. cilensis* Podlech, *A. qoturensis* Podlech, *A. hirticalyx* Boiss. & Kotschy ex Boiss., *A. zohrabi* Bunge, and *A. hymenocystis* Fisch & C.A.Mey. in this region. The corolla in all these species is purple and the habits (e.g., peduncle length, leaflet shape and length, bract shape and length) are very similar to each other. For this reason, it is often very hard to distinguish the species from each other during field work in this region.

Podlech and Zarre (2013) stated that *A. marivanensis* Maassoumi & Podlech, a member of the section *Hymenostegis* described originally from Iran, is also found in Turkey. The plant materials of this species were collected from Bitlis Hanemir Mountain by T. Engel and there are two samples on one herbarium sheet labeled as T. Engel 109 stored in MSB. While the peduncle and rachis are spreading hairy in *A. marivanensis*, they are adpressed to subadpressed in *A. lagopoides* Lam. Our observation showed that while one of the samples (T. Engel 109) includes both spreading and adpressed to subadpressed hairs on the rachises, the other one has only adpressed to subadpressed hairs. Furthermore, especially among the older individuals representing *A. lagopoides*, we also observed erect hairs towards the base of the rachis along with semierect/subadpressed hairs. Our observations on herbarium specimens and field studies showed that the samples from Bitlis Hanemir Mountain deposited in MSB indeed represent *A. lagopoides*.

There are three samples (Cheese & Watson 2950! and Lemond 2650! and Hub-Mor 11444) described as *A. persicus* by Chamberlain and Matthews (1970) in the *Flora of Turkey*. Based on sample deposited in E, we found that this specimen belongs to *A. zohrabi* Bunge in fact. The specimen of Lemond 2562 was determined as *A. persicus* (DC) Fisch. & C.A.Mey. by Chamberlain and Matthews (1970). However, it was identified as *A. lagopoides* Bunge, which is present in E, by Douglas McKean. *A. persicus* is also reported from the Chasm of Çuh in the Güzeldere district of Van (Chamberlain and Matthews, 1970), where *A. cilensis*, *A. qoturensis*, *A. zohrabi*, and *A. hirticalyx*, which are morphologically very similar to *A. persicus*, are widely distributed. The main discrepancy between *A. persicus* and the other species of the section *Hymenostegis* is the hairs on the inner side calyx. Moreover, Podlech and Zarre (2013) indicated that this species is endemic in the W Iranian Zagros mountains. All indications outside of this area are based on misinterpretations. In light of these data, *A. persicus* is here excluded from the flora of Turkey.

Astragalus expetitus Maassoumi was recorded as a new species for the Turkish flora by Podlech and Ekici (2008) based on an individual collected from Muradiye near Van (Sorger 81-10-1). However, Sorger's sample stored in W! was identified as *A. hymenocystis* Fisch. & C.A.Mey. by S Karaman Erkul. Some of the characteristics that separate *A. expetitus* from *A. hymenocystis* are as follows: leaflets ascending and spreading (not adpressed to subadpressed) hairy, and the bracts glabrous (not sparse or dense hairy). *Astragalus expetitus* is excluded from the list of Turkish species of *Astragalus*.

Our research shows that there are 13 species belonging to the sect. *Hymenostegis* in Turkey, three of which are endemic.

A revised key of *Astragalus* sect. *Hymenostegis* in Turkey

1. Petal yellow
2. Stipules hairy
 3. Stipules 13–17 mm; leaves (1.5–) 3–8 cm; peduncles 1–4 cm *A. velenovskyi*
 3. Stipules 30–35 mm; leaves 9–20 cm; peduncles 24–28 cm *A. narmanicus*
2. Stipules glabrous or only ciliate at the margins
 4. Peduncle ascending – spreading hairy
 5. Bracts deciduous; rachis adpressed to subadpressed hairy with sparsely ascending hairs *A. gueruenensis*
 5. Bracts persistent; rachis ascending-spreading hairy *A. sosnowskyi*
 4. Peduncle adpressed to subadpressed hairy *A. lagopoides*
1. Petal pink-purple or red-purple
 6. Inflorescence lax
 7. Peduncle ascending-spreading hairy *A. zohrabi*
 7. Peduncle adpressed to subadpressed hairy *A. rubrostriatus*
 6. Inflorescence dense
 8. Peduncle ascending-spreading hairy
 9. Rachis adpressed to subadpressed hairy with sparsely ascending hairs
 10. Standard angular-hastate *A. uraniolimneus*
 10. Standard not angular-hastate
 11. Standard glabrous *A. ciloensis*
 11. Standard hairy *A. qoturensis*
 9. Rachis ascending-spreading hairy
 12. Stipule hyaline-membranous; peduncle longer than leaves or equal
 13. Stipules with densely netlike nerves in lower part; legume 7–9 mm *A. uraniolimneus*
 13. Stipules without densely netlike nerves in lower part; legume 4–6 mm *A. hymenocystis*
 12. Stipule papery; peduncle shorter than leaves *A. hirticalyx*
 8. Peduncle adpressed to subadpressed hairy, with sparsely ascending hairs
 13. Leaflets 1–3 pairs, upper side glabrous, inner side sparsely hairy; stipule hairy .. *A. trifoliastrum*
 13. Leaflets 4–6 pairs, both sides dense hairy; stipule glabrous *A. lagopoides*

Astragalus ciloensis Podlech, Feddes Report. 120: 51. 2009.

Distribution: Irano-Turanian element. Endemic.

Conservation status: VU: B2 ab (i, ii, iv)

This species was published by Podlech (2009) based on a sample (P.H. Davis and O. Polunin 23974) that was collected in Turkey. Although the type specimens are available at both

E and ANK, we also collected more plant materials from the type locality and neighboring areas during our research.

Astragalus gueruenensis Podlech, Podlech D. & Zarre S. 2013. A taxonomic revision of the genus *Astragalus* L. (Leguminosae) in the Old World, vol. 2, 1290. Naturhistorisches Museum Wien.

Distribution: Irano-Turanian element. Endemic.

Conservation status: VU: B2 ab (i, ii, iv)

In the *Flora of Turkey*, footnotes under *A. hirticalyx* indicate that the sample collected by Simon & Hub.-Mor. 15070 is an intermediate species between *A. hirticalyx* and *A. persicus*. It was reported that it has a short peduncle and ovoid inflorescence like in *A. hirticalyx* and also a glabrous and hairy bract (Chamberlain and Matthews, 1970). This sample was published by Podlech (Podlech and Zarre, 2013) as a new species under the name *A. gueruenensis*.

Astragalus gueruenensis, which was only known from the type locality before our research, was collected during the field study in Van Province. Some missing items and measuring errors due to deficiencies of the type collection are improved in the description provided. In this study, the legume and seed characters were indicated; legumes subsessile, ovate-ellipsoid, 7–8 × 4–5 mm long, keeled ventrally, flattened dorsally; densely villose hairy. Seed only one, ellipsoid-reniform, dark brown and black spotted, 2 × 3 mm. *A. gueruenensis* was initially identified by Podlech (Podlech and Zarre, 2013) as having purple flowers, despite actually having yellow flowers (at maturity sometimes turning purple).

Astragalus hirticalyx Bunge, Mém. Acad. Imp. Sci. Saint Pétersbourg 11(16): 67. 1868 in clave [et l.c. 15(1): 110. 1869].

Distribution: Iraq, Iran, Turkey. Irano-Turanian element.

It is well known that the flower is purple in *A. hirticalyx*. However, during the field study conducted in the Güzeldere region of Van Province, a specimen with a white corolla was also observed.

Astragalus hymenocystis Fisch. & C.A.Mey., Bull. Soc. Imp. Naturalistes Moscou 26(2): 449. 1853.

Distribution: Iran, Turkey. Irano-Turanian element.

A. hymenocystis Fisch. & C.A.Mey. was examined at specific level in the *Flora of Turkey* by Chamberlain and Matthews (1970). Later, Zarre (1996) identified two subspecies in his revisional study; subsp. *hymenocystis* and subsp. *confiniorum* Zarre & Podlech. *A. hymenocystis* subsp. *hymenocystis* was separated from all other species in the section *Hymenostegis* by its yellow-brown hairs.

Subsequently, *A. hymenocystis* subsp. *confiniorum* Zarre & Podlech was added to the flora of Turkey (Aytaç, 2000).

A. pereshkhoranicus was given as a new record for Turkey without any plant material or location being given (Özhatay and Kültür, 2006). Furthermore, the type locality of *A. pereshkhoranicus* Maassoumi & F. Ghahrem.

is known from Iran. On the other hand, *A. hymenocystis* subsp. *confiniorum* is considered a synonym of *A. pereshkhoranicus* by Podlech and Zarre (2013).

This taxon is considered a synonym of *A. pereshkhoranicus* Maassoumi & F. Ghahrem. (Podlech and Zarre, 2013). *A. pereshkhoranicus* was given as a new record for Turkey. However, no locality for Turkey was given and the type locality of the species was published as Iran. *A. hymenocystis* subsp. *confiniorum* subspecies is actually a synonym.

Astragalus hymenocystis is separated from *A. pereshkhoranicus* by the following characteristics: 3–6 pairs of leaflets (not 5–6 pairs), elliptic obovate (not narrowly elliptic) and $3-7 \times 2-4$ mm (not $5-8 \times 1.5-2.5$ mm), bracts hyaline on the edges (not hyaline–membranous), calyx teeth 4–7 mm long (7–12 mm) (Podlech and Zarre, 2013).

Astragalus hymenocystis was also recorded in the *Flora of Turkey* from Muradiye, Van (Aytaç, 2000). As a result of our field investigations in this region and visiting national and foreign herbaria, it was concluded that *A. pereshkhoranicus* does not exist in Turkey. Podlech and Zarre (2013) also stated that this species does not grow in Turkey.

Astragalus lagopoides Lam., Enycl. Méth. Bot. 1: 322. 1783.

Distribution: Azerbaijan, Armenia, Iran, Turkey. Irano-Turanian element.

Astragalus brachypodus, which is mentioned as a member of the sect. *Hymenostegis* in the *Flora of Turkey* is synonymous of *A. lagopoides* (Zarre, 1996). It is separated from *A. lagopoides* by the following characteristics: peduncle shorter than leaves and flowers are ovoid instead of rectangular (Chamberlain and Matthews, 1970). Specified locations where *A. brachypodus* is reported were investigated and specimens were collected. Our study showed that in some samples the peduncle does not exceed the length of the leaves, whereas in other samples it is longer. In addition, the inflorescence is ovoid or often cylindrical, indicating the high level of variability regarding this character.

Our intensive collection from the type locality of *A. sonamerensis* has shown that the only taxon of the sect. *Hymenostegis* distributed in this area is *A. lagopoides*. Therefore, in contradiction with Podlech (2011), we put *A. sonamerensis* under synonymy of *A. lagopoides*, not under *A. sosnowskyi* as suggested doubtfully by Podlech (2011) and Podlech and Zarre (2013).

There are footnotes under *A. lagopodioides* in the *Flora of Turkey* explaining that *A. lagopoides* was initially identified by Lamarck (1785) as having yellow flowers, despite actually having purple flowers. The footnote continues to clarify that this confusion resulted from dry material. Thus, it was stated that *A. lagopoides* should be

synonymous with *A. lagopodioides*. During field studies, several samples of *A. lagopoides* from different localities were collected. Samples show that flowers are mostly yellow when blooming and turn purple from the top of the standard. For this reason, corolla color of *A. lagopoides* is given both as purple and as yellow in two different places in our diagnostic key.

Astragalus narmanicus Karaman & Aytaç, sp. nov.
(Figures 1–2).

Type: Turkey, A8 Erzurum: Between Narman and Oltu, steppe, 1916 m, 08.07.2014, S. Karaman 2897 & Z. Aytaç (holo. GAZI, iso. ANK, GAZI).

Diagnosis: It is closely related to *A. velenovskyi*, but differs from it by longer peduncle than leaves, (not as long as or shorter); longer stipules 30–35 mm, not (13–17 mm); leaflets 6–9 pairs [not (3–)4–6(–7)]; and longer bracts $25-30 \times 7-10$ mm [not $8-14 \times 3.5-6(-9)$ mm]. It is also similar to *A. lagopoides*, but differs from it by longer stipules 30–35 mm (not 12–30 mm); longer peduncle 24–28 cm [not (2–) 6–15(–20) cm] and longer bracts $25-30 \times 7-10$ mm (not 14–23 \times 3.5–8 mm). Sometimes can be mistaken for *A. hymenostegis*, but peduncle 24–28 cm (not 3–15 cm) and bracts 25–30 mm (not 18 \times 7–12 mm) may be used for their separation.

Description: Plants subshrubby, caespitose, 25–45 cm tall, spiny. Stipules chartaceous, slightly hyaline toward the tip, yellowish, 30–35 mm, 23–25 mm adnate to the petiole, connate behind the stem for 8–10 mm, the free tips narrowly triangular, densely hairy at the midline, tip and ciliate at the margins with ascending hairs up to 2 mm. Leaves 9–20 cm; petiole 3–10 cm, like the rachis rather densely to very densely covered by adpressed and few ascending hairs 0.5–1 mm, spiny. Leaflets in 6–9 pairs, narrowly elliptic, 12–22 \times 2–5 mm, acute to acuminate, with a pungent yellowish cusp 1.5–2 mm, on both surface densely adpressed to somewhat spreading hairy. Peduncles 24–28 cm, longer than the leaves, erect, densely adpressed hairy mixed with some ascending hairs, adpressed hairs 1–1.5 mm and ascending hairs 0.5–1 mm. Racemes long cylindrical, 8–13 cm long and 2.5–3 cm in diameter, densely many-flowered. Bracts persistent, glumaceous, pale yellowish, narrowly hyaline at the margins, 25–30 \times 7–10 mm, widely ovate acuminate, with a cusp up to 5 mm, hairy dense hairy at the midline and ciliate at the margins, on inner side mostly hairy toward the tip. Calyx tubular at first, soon ellipsoid-inflated, 17–19 \times 3–4 mm, pale yellow, with greenish teeth, rather densely covered with spreading hairs 3–4 mm and with long hairs up to 5 mm, mostly sparsely hairy in upper part of tube on inner side; teeth subulate, 5–6 mm. Petals yellow. Standard 14–18 mm, sometimes slightly shorter than the calyx; blade 6–8 mm wide, trullate to elliptic or ovate-panduriform and in this case shallowly constricted below the middle,

Figure 1. Type specimen of *Astragalus narmanicus* (GAZI).

slightly retuse, at the base sharply angular-hastate to obtusely angular, with widely cuneate claw. Wings 13–17 mm; blades narrowly oblong to narrowly elliptic, obtuse, 6–7 × 2–2.8 mm; auricle 0.3–0.6 mm, claw 7–10 mm. Keel 12–15 mm; blades obliquely obovate, subacute, with rectangularly curved lower edge and slightly convex upper edge, 5–6 × 2.5–3 mm; auricle minute, claw 7–10 mm. Ovary c. 4–5 mm, ellipsoid, densely hairy; style hairy up to the middle. Legumes sessile, 5–7 mm long, 1.5–2.5 × 2.5–3 mm, densely subadpressed hairy. Seed one, olive green to red or dark brown, 3–4 × 1.5–2.5 mm, pitted.

Etymology: The specific epithet is derived from the locality of the type specimen, Narman, Erzurum Province. Flowering time is late July.

Distribution, habitat, and ecology: Turkey, endemic, ca. 1900 m. It grows on high mountain steppe with

Figure 2. *Astragalus narmanicus* in natural habitat.

Astragalus lagopoides, *A. voronovianus* (Boriss.) Boriss., *A. oleaeifolius* DC., *Rosa canina* L. *Palirus spina-chrستی* P.Mill., *Stipa holsericea* Trin. *Poa bulbosa* L., *Poa longifolia* Trin, *Taeniatherum caput-medusae* (L.) Nevski, *Pimpinella corymbosa* Boiss., *Prangos pabularia* Lindl. etc.

Conservation status: This species is found in Narman. It can be found as a small, separate (less than five locations), and small-numbered population (less than 50 mature individuals) in the area. Its population is under anthropogenic effects (recreational activities, fire, and sometimes grazing). The new species should be regarded as critically endangered (CR B2ab (i, ii, iv) based on IUCN conservation status (IUCN, 2014).

Astragalus qoturensis Podlech, Fl. Iranica, *Astragalus* II, Lief. 175: 171. 2001 (July) and in Sendtnera 7: 209. 2001.

Distribution: Iran, Turkey. Irano-Turanian element.

A. qoturensis was known as endemic to Iran until the current study, but during our field studies we also collected it in Turkey in Van Province (Podlech and Zarre, 2013; Karaman Erkul et al., 2015). *Astragalus qoturensis* is the only species of the sect. *Hymenostegia* in Turkey having a hairy standard. Additionally, we observed that the indumentum of bracts may vary from glabrous to densely hairy in contrast to the description provided by Podlech and Zarre (2013).

Astragalus rubrostriatus Bunge, Mém. Acad. Imp. Sci. Saint Pétersbourg 11(16): 68. 1868 inclave [et l.c. 15(1): 113. 1869].

Distribution: Armenia, Iran, Turkey. Irano-Turanian element.

This species is characterized by lax inflorescences, striate calyces, and red to purple petals.

Astragalus sosnowskyi Grossh., Fl. Kavkaza 2: 299. 1930, in clave, [Russian], et in Trudy Tbilissk. Bot. Inst. 12: 236. 1948, descr. emend.

Distribution: Georgia, Iran, Turkey. Irano-Turanian element.

Astragalus trifoliastrum Hub.-Mor. & V.A. Matthews, Notes Roy. Bot. Gard. Edinburgh 29: 301. 1969.

Type: Turkey, B9 Van, Van – Hosap, 20 km N Van, 1950 m, 8.07.1951, J. Renz & Simon in herb. Huber-Morath 11467 (Gl!: photo. MSB!).

Distribution: Irano-Turanian element. Endemic.

Conservation status: VU: B2 ab (i,ii,iv)

Astragalus trifoliastrum was recently reduced to a synonym of *A. laguriformis* Freyn (Zarre, 1996). However, *A. trifoliastrum* is not actually synonymous; it is reclassified and recorded again (Bagheri et al., 2015). Morphologically, *A. trifoliastrum* can be distinguished from *A. laguriformis* by oblong to elliptic leaflets (not narrowly elliptic), ca. 6–12 mm wide (not ca. 2.0–3.5 mm), with upper side glabrous and lower side sparsely covered with very short adpressed hairs (not both sides densely covered with adpressed hairs), ovoid raceme (not globose to ovoid), ca. 4–7 cm long (not 2–5 cm), purplish calyx (not yellowish) with ascending to almost spreading hairs (not rather densely covered with short, spreading and with ascending to nearly spreading hairs) (Bagheri et al., 2015).

Astragalus uraniolimneus Boiss., Fl. Or. 2: 380. 1872

Distribution: Armenia, Iran, Turkey. Irano-Turanian element.

Astragalus uraniolimneus was recorded doubtfully from Turkey. *Astragalus woronowii*, which was considered a separate species in the *Flora of Turkey* (Chamberlain and Matthews, 1970), has been reduced to synonymy with *A. uraniolimneus* by Zarre and Podlech (1996).

Astragalus velenovskyi Nábělek, Spisy Prir. Fak. Masarykovy Univ. 35: 82, 1923.

Distribution: Irano-Turanian element. Endemic.

Conservation status: VU, B2 ab (i, ii, iv)

Astragalus zohrabi Bunge, Mém. Acad. Imp. Sci. Saint Pétersbourg 11(16): 68. 1868 in clave [et l.c. 15(1): 112. 1869].

Distribution: Iran, Turkey. Irano-Turanian element.

Astragalus zohrabi was given as a synonym of *A. lagopodioides* in the *Flora of Turkey* (Chamberlain and Matthews, 1970). Later, *A. lagopodioides* was reduced to a synonym of *A. zohrabi* (Podlech, 2011). *A. zohrabi* is separated from other species in the sect. *Hymenostegia* in Turkey by having a lax inflorescence.

Additionally, during our field study, *A. rubrostriatus*, another species of the section with lax inflorescences, which was thought to be endemic to Iran, was collected from the Van region as a new record for the Turkish flora (Karaman Erkul et al., 2015).

3.3. *Astragalus* L. sect. *Macrophyllum* Boiss., Fl. Or. 2: 214, 1872.

The number of species within *Macrophyllum* in the flora of Turkey was thought to be nine, five of which are endemic (Chamberlain and Matthews, 1970). However, Zarre's research reduced the number of species in Turkey to five

and the number of endemic species to one (Zarre, 2000). Our research published *A. yukselii* within the section *Macrophyllum* and increased the number of species within this section to six and the number of endemic species to two (Karaman Erkul and Aytaç, 2013).

A revised key of *Astragalus* sect. *Macrophyllum* in Turkey

1. Stipule hyaline–membranous
2. Leaflets and rachis glabrous; bracts linear, glabrous; bracteoles absent... *A. isauricus*
2. Leaflets and rachis hairy; bracts ovate–lanceolate, hairy; bracteoles present *A. yukselii*
1. Stipules chartaceous
3. Leaflets densely to sparsely tomentose hairy above *A. dipodurus*
3. Leaflets sparsely adpressed hairy or glabrous above
4. Bracts linear *A. oleaefolius*
4. Bracts ovate–lanceolate
5. Leaflets with obvious venation, median ones acute or obtuse, mucro 0.7–3 mm *A. longifolius*
5. Leaflets without obvious venation, not mucronulate or with mucro shorter than 0.5 mm *A. cephalotes*

Astragalus cephalotes Banks & Sol., Russell, Nat. Hist. Aleppo, ed. 2: 260. 1794.

Distribution: Turkey, Georgia, Syria, Lebanon, Iran. Irano-Turanian element.

Because of having bracteoles, *A. cephalotes* was classified and placed in the section *Pterophorus* by Boissier (1872). However, Zarre (2000) transferred this species into the sect. *Macrophyllum*, by possessing large and glabrous leaves. In the *Flora of Turkey*, *A. cephalotes* is placed in the sect. *Rhacophorus* (Chamberlain and Matthews, 1970). However, our morphological findings support treating *A. cephalotes* under the sect. *Macrophyllum* in agreement with Zarre (2000).

Astragalus dipodurus Bunge, Mém. Acad. Imp. Sei. Saint Petersbourg 11(16): 88. 1868, in clave et l.c. 15(1): 156. 1869.

Distribution: Iran, Syria, Turkey. Irano-Turanian element.

Astragalus isauricus Hub.-Mor. & V.A. Matthews, Notes Roy. Bot. Gard. Edinburgh 29: 298. 1969.

Distribution: Irano-Turanian element. Endemic.

Conservation status: EN: B2 ab (i, ii, iv)

Astragalus longifolius Lam., Encycl. Meth. Bot. 1: 322. 1783.

Distribution: Iraq, Turkey. Irano-Turanian element.

Astragalus oleaefolius DC., Astragalologia: 192. 1802.

Distribution: Azerbaijan, Armenia, Iraq, Iran, Lebanon, Syria, Jordan, Turkey. Irano-Turanian element.

Astragalus yukselii Karaman & Aytaç, Turk. J. Bot. 37: 836–840, 2013.

Distribution: Irano-Turanian element. Endemic.

Conservation status: CR: B1ab (i, ii, iv)

Acknowledgments

We would like to thank the Scientific and Technological Research Council of Turkey (TÜBİTAK) for financially supporting this study (Project No: TBAG 110 T 911), all

the curators of herbaria that we visited, all the botanists who helped during the fieldwork, Dr Dieter Podlech, Dr Ali Asghar Maassoumi, Dr Shahin Zarre, and Ali Bagheri.
