Received 22.10.2004

3-Phenyl-6-methyl-4(3H)-quinazolinone-2-yl-mercaptoacetic acid hydrazide (**3**) was reacted with substituted aldehydes in absolute ethanol to obtain a new series, 3-phenyl-6-methyl-4(3H)-quinazolinone-2yl-mercaptoacetic acid arylidenehydrazides (**4a-q**). The structures of **4a-q** were elucidated by elemental analyses and from spectrometric (UV, IR, ¹H-NMR, ¹³C-NMR and EIMS) data. Then **4a-q** were evaluated for antibacterial, antifungal and antitubercular activities. No significant activity was observed against the selected microorganisms.

Key Words: 4(3H)-Quinazolinone, arylidenehydrazide, synthesis, antimicrobial activity.

Introduction

Compounds containing the 4(3H)-quinazolinone ring have been reported to possess different biological activities such as antibacterial¹, antifungal^{2,3}, antitubercular⁴, antiviral⁵, anticancer^{6,7} and anticonvulsant⁸ activity depending on the substituents in the ring system. In addition, literature surveys show that quinazolinone hydrazones exhibit antimicrobial^{9,10} and anticonvulsant^{11,12} activity. In view of the above considerations we planned the present study to further investigate this ring system.

Experimental

Melting points were estimated with a Büchi 530 melting point apparatus in open capillaries and are uncorrected. Elemental analyses were performed on a Carlo Erba 1106 elemental analyzer. UV spectra

 $^{^{*} {\}rm Corresponding} \ {\rm author}$

were determined on a Shimadzu UV-1601. IR spectra were recorded on KBr disks, using a Perkin-Elmer Model 1600 FT-IR spectrometer. ¹H-NMR and ¹³C-NMR spectra were obtained on a Bruker AC 200 (200 MHz and 50.3 MHz) spectrophotometer. EIMS were determined on a VG Zab Spec (70 eV) mass spectrometer.

Synthesis of 3-phenyl-6-methyl-4(1H,3H)-quinazolinone-2-thione (1)¹³

To a solution of 5-methylantranilic acid (0.05 mol) in 30 mL of absolute ethanol was added phenyl isothiocyanate (0.05 mol). The reaction mixture was refluxed on a water bath for 5.5 h. The products formed were filtered and recrystallized from ethanol.

Synthesis of 3-phenyl-6-methyl-4(3H)-quinazolinone-2-ylmercaptoacetic acid ethyl ester $(2)^{14}$

To a solution of 1 (0.02 mol) in 30 mL of dimethylformamide were added ethyl bromoacetate (0.024 mol) and 10 g of K_2CO_3 . The reaction mixture was refluxed on a water bath for 2 h, poured into ice-water and allowed to stand overnight. The precipitate was filtered and recrystallized from ethanol.

Synthesis of 3-phenyl-6-methyl-4(3H)-quinazolinone-2-ylmercaptoacetic acid hydrazide $(3)^{14}$

To a solution of 2 (0.01 mol) in 50 mL of absolute ethanol was added hydrazine hydrate (0.02 mol). The reaction mixture was refluxed on a water bath for 4 h and allowed to stand overnight. The crystals formed were filtered, washed and after drying recrystallized from ethanol.

Synthesis of 3-phenyl-6-methyl-4(3H)-quinazolinone-2-ylmercaptoacetic acid arylidenehydrazides (4a-q)

To a solution of $\mathbf{3}$ (0.01 mol) in absolute ethanol was added substituted benzaldehyde (0.01 mol). The reaction mixture was refluxed on a water bath for 4 h. The product formed after cooling was filtered and recrystallized from ethanol.

Results and Discussion

In this research, 3-phenyl-6-methyl-4(1H,3H)-quinazolinone-2-thione $(1)^{13}$ synthesized from the reaction of 5-methylantranilic acid with phenylisothiocyanate was reacted with ethyl bromoacetate in alkaline medium to yield 3-phenyl-6-methyl-4(3H)-quinazolinone-2-yl-mercaptoacetic acid ethyl ester $(2)^{14}$. Subsequent treatment of **2** with hydrazine hydrate in absolute ethanol afforded 3-phenyl-6-methyl-4(3H)-quinazolinone-2-yl-mercaptoacetic acid atylide than to obtain 17 new 3-phenyl-6-methyl-4(3H)-quinazolinone-2-yl-mercaptoacetic acid arylidenehydrazides (**4a-q**). The structures of the new compounds were confirmed by elemental analyses and from spectrometric (UV, IR, ¹H-NMR, ¹³C-NMR and EIMS) data (Scheme 1) (Tables 1-5).

The maxima observed in the UV spectra were associated with the parent molecule and incorporation of the arylidene moiety brought about no significant change. Only slight bathochromic shifts were observed in **4a-q**, where the arylidene moiety had electron donating and electron attracting groups. IR spectra of **4a-q** showed 2 bands resulting from the CO stretching bands of the lactam and arylidenehydrazide functions in the 1697-1667 and 1693-1641 cm⁻¹ regions, respectively^{15,16}. In the spectra of the compounds the NH and N=CH bands of the arylidenehydrazide function were observed in the 3230-3108 and 1620-1606 cm⁻¹ regions, respectively^{14,17} The ¹H-NMR spectra in DMSO-d₆ revealed the existence of 2 isomers. Restricted rotation about the N=CH linkage led to the formation of E and Z isomers. Thus the resonances associated with the SCH₂CO, N=CH and CONH were observed as 2 singlets, which integrated to give 2H, 1H, and 1H, respectively. The isomeric ratio was calculated using the integral values of the peak pairs. The dominating isomer was assigned to the E structure, where the steric effects of the functional groups were minimum. It was also the more stable structure with lower energy (Figure).

Figure. The formation of E and Z isomers of 4a.

Table 5. Contunied.

Scheme 2

In the spectra of **4a-q** the SCH₂CO, N=CH and CONH protons were observed as 2 singlets (3.24-4.00 and 3.97-4.47 ppm; 7.90-8.42 and 8.11-8.68 ppm; 11.35-12.01 and 11.43-12.12 ppm). Quinazolinone C₅-H resonated at 7.87-7.88 ppm as a singlet. Quinazolinone C₇-H and C₈-H displayed 2 different doublets due to ortho interactions at 7.44-7.49 and 7.38-7.45 ppm, respectively¹⁸⁻²⁰. Like in the ¹H-NMR spectra, in the ¹³C-NMR spectra of **4b**, **4e**, **4f** and **4k**, chosen as prototypes, the resonances of the SCH₂, N=CH and CONH groups were observed as 2 peaks (34.00-34.94 and 35.18-36.21 ppm; 138.76-145.81 and 142.15-146.77 ppm; 163.17-164.23 and 168.43-169.43 ppm) because of the existence of both E and Z isomers^{18,20,21}. The molecular ion peaks in the EI-MS of **4a-q** confirmed their molecular weights. In accordance with the literature, the compounds fragmented via 4 common routes, the first and second of which involved the cleavage of the CO-NH or N-N bond. The third and fourth involved the cleavages of SCH₂ or the thioether and amide linkage at the 2 position of quinazolinone, followed by the binding of the rest of the side chain to the ring. The cleavage of the SCH₂ bond gave the fragment at m/z 309 as the base peak in **4a-h** and **4j-o**, whereas the cleavage of the SCH₂ bond gave the fragment at m/z 267 as the base peak in **4i** and **4q**^{17,21,22} (Scheme 2).

In line with the reports stating that hydrazides and hydrazide-hydrazones possessed antitubercular, antibacterial and antifungal activities, **4a-q** were tested against *Staphylococcus aureus* ATCC 6538, *Staphylococcus epidermidis* ATCC 12228, *Escherichia coli* ATCC 8739, *Klebsiella pneumoniae* ATCC 4352, *Pseudomonas aeruginosa* ATCC 1539, *Proteus mirabilis* ATCC 14153, *Salmonella typhi*, *Shigella flexneri* and *Candida albicans* ATCC 10231²³. No significant activity was observed against the selected microorganisms. **4a-q** were also tested against *Mycobacterium tuberculosis* $H_{37}R_v$ employing the BACTEC radiometric sensitivity test but were found inactive at 6.5 μ g/mL^{24,25}.

This work was supported by Istanbul University Research Fund Project Number: T-885/ 17072000
