# Structure of 1-(Thiophen-2-ylmethyl)-2-(thiophen-2-yl)-1H-benzimidazole 

Necmi DEGE ${ }^{1 *}$, Memet ŞEKERCi $\dot{I}^{2}$, Süleyman SERVi ${ }^{2}$, Muharrem DİNÇER ${ }^{1}$, Ünzile DEMİRBAŞ3 ${ }^{2}$<br>${ }^{1}$ Ondokuz Mayıs University, Faculty of Arts and Sciences, Department of Physics, 55139, Samsun-TURKEY<br>e-mail: dege@omu.edu.tr<br>${ }^{2}$ Firat University, Faculty of Arts and Sciences, Department of Chemistry, 23119 Elazığ-TURKEY

Received 16.06.2005

The title compound, $\mathrm{C}_{16} \mathrm{H}_{12} \mathrm{~N}_{2} \mathrm{~S}_{2}$, crystallizes in the monoclinic space group $\mathrm{P} 2_{1} / \mathrm{n}$ with $\mathrm{Z}=4$, $a=8.950$ (5) $\AA, b=9.141$ (5) $\AA, c=17.429$ (5) $\AA$ and $\beta=93.638$ (5) ${ }^{\circ}$. The benzimidazole ring is essentially planar. The crystal structure is stabilized by intermolecular $\mathrm{C}-\mathrm{H} \cdots \mathrm{N}$ and $\mathrm{C}-\mathrm{H} \cdots \pi$ contacts.

## Introduction

The benzimidazole ring is a crucial pharmacophore in drug discovery. Benzimidazoles show different biological activities, such as anticancer, antimicrobial, or anthelmintic activities ${ }^{1}$. Benzimidazole derivatives are a unique broad-spectrum class of antirhino/enteroviral agents. Benzimidazoles exhibit significant activities against several viruses including HIV, herpes (HSV-1), RNA, influenza and human cytomegalovirus (HCMV) ${ }^{2}$. The synthesis of benzimidazoles has received much attention owing to the varied biological activity exhibited by a number of these compounds. The synthesis of heteroaryl substituted- 1 H benzimidazoles has become of recent interest to medicinal chemists owing to the pharmacophoric properties of the heteroaromatic rings. A number of synthetic methods have been developed in recent years to uncover a variety of new reagents for the synthesis of 2 -substituted benzimidazoles ${ }^{3-8}$. Benzimidazoles can be synthesized by a number of methods, usually involving formation of the $\mathrm{N}-\mathrm{C}-\mathrm{N}$ unit as the key step. One of the formerly utilized general routes to benzimidazoles involves the reaction of aldehydes and ketones with $o$-phenylenediamine. Although there are several routes leading to 2 -substituted benzimidazoles, a typical procedure involves heating o-phenylenediamine with a substituted carboxylic acid in the presence of a mineral acid ${ }^{9-10}$. In this context, we have synthesized several new aryl substituted benzimidazoles, including the title compound.

## Experimental

## Instrumentation

Single-crystal X-ray data were collected on a Stoe X-AREA single crystal diffractometer using monochromated MoK $\alpha$ radiation at 296 K. Semi-empirical absorption corrections were made from equivalents. The structure was solved by direct and conventional Fourier methods. H atoms were placed geometrically [0.93 $\AA(\mathrm{C}-\mathrm{H})]$ and allowed to ride on their parent atoms, with $\operatorname{Uiso}(\mathrm{H})=1.2 \mathrm{Ueq}(\mathrm{C})$. The program used for cell refinement: Stoe X-AREA ${ }^{11}$. Program used to solve structure: SHELXS-97 ${ }^{12}$. Molecular graphics: ORTEP-3 for Windows ${ }^{13}$ and PLATON ${ }^{14}$. Software used to prepare material for publication: WinGX ${ }^{15}$ publication routines. Further details concerning data collection and refinement are given in Table 1.

Table 1. Crystal data and structure refinement.

| Formula | $\mathrm{C}_{16} \mathrm{H}_{12} \mathrm{~N}_{2} \mathrm{~S}_{2}$ |

| Largest diff. peak and hole | $0.555 \mathrm{e} . \AA \AA^{-3}$ and $-0.414 \mathrm{e} . \AA^{-3}$ |

## Synthesis

A solution of 1,2-diaminobenzene ( 0.01 mol ) in absolute ethanol ( 20 mL ) was added in small portions to a solution of thiophen-2-carbaldehyde ( 0.02 mol ) in absolute ethanol $(30 \mathrm{~mL})$. The reaction mixture was maintained at $70{ }^{\circ} \mathrm{C}$ for 4 h , cooled and then added to ice-cold water. The resulting solid was washed with water, dried and recrystallized from ethanol (yield: 70\%; m.p. 424 K ). IR ( $\mathrm{cm}^{-1}$ ): 3063 ( Ar H ), 1589 $(\mathrm{C}=\mathrm{C}), 1568(\mathrm{C}=\mathrm{N}), 1159(\mathrm{C}-\mathrm{N}) ;{ }^{1} \mathrm{H}-\mathrm{NMR}: \delta 5.62\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{NH}_{2}\right), 6.83-7.78(\mathrm{~m}, 10 \mathrm{H}, \mathrm{Ar} \mathrm{H}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}: \delta$ $45.7,111.7,121.8,124.7,125.7,127.2,129,130,130.6,164.8$.

## Results and Discussion

The molecular structure of the title compound is depicted in Figure 1. The title compound contains 3 planar rings. One is the benzimidazole ring ( $\mathrm{N} 1, \mathrm{~N} 2, \mathrm{C} 1-\mathrm{C} 7$ ); the others are the thiophene rings. The benzimidazole ring in Figure 1 is essentially planar, with a maximum deviation of -0.007 (3) $\AA$ for atom C6 (Figure 2). Selected bond lengths and angles are given in Table 2. The thiophene group [A (S2,C13-C16)], attached to C1, is planar and forms a dihedral angle of $24.43(12)^{\circ}$ with the benzimidazole plane. This distortion is probably determined by the interaction between the thiophene group and the C8 methylene

Figure 1. The chemical diagram.

Figure 2. An ORTEP- $3^{13}$ drawing of the title compound with atom-numbering scheme. Displacement ellipsoids are drawn at the $50 \%$ probability level.

Structure of 1-(Thiophen-2-ylmethyl)-2-(thiophen-2-yl)-1H-benzimidazole, N. DEGE, et al.,
group. The thienyl ring [ $\mathrm{B}(\mathrm{S} 1, \mathrm{C} 9-\mathrm{C} 12)]$ was attached to the C 8 methylene group almost perpendicular to the benzimidazole plane (with a dihedral angle of $\left.85.27(11)^{\circ}\right)$. This ring is disordered (probably swinging about the $\mathrm{C} 8-\mathrm{C} 9$ bond) as is found in other compounds ${ }^{16,17}$. These 2 thienyl rings ( A and B ) form a dihedral angle of $84.74(13)^{\circ}$. The C8-C9, N1—C8 and N2-C1 bond distances are 1.501 (3), 1.452 (3) and $1.315(3)$ $\AA$, respectively, which are similar to the corresponding bond lengths in clemizole [1.492 (6), 1.477(5) and $1.328(5) \AA$, respectively ${ }^{18}$, clemizole hydrochloride $[1.491(10), 1.475(9) \text { and } 1.325(8) \AA \text {, respectively }]^{19}$ and clemizoledichlorocobalt(II) $[1.521 \text { (8), } 1.479(7) \text { and } 1.337 \text { (7) } \AA \text {, respectively }]^{20}$. The S1—C9 bond length of 1.706 (2) $\AA$ is similar to the corresponding bond lengths in N-benzyl-2,5-bis(2-thienyl)pyrrole [1.7288 (18) $\AA]^{21}$ and 2-[(4-Hydroxyphenyl)iminomethyl]-thiophene $[1.712(2) \AA]^{22}$.

Intermolecular $\mathrm{C}-\mathrm{H} \cdots \mathrm{N}$ close contacts (Table 3) stabilize the crystal structure, forming molecular chains extending approximately parallel to the c axis and stacked along the b axis (Figure 3). The crystal structure also contains $\mathrm{C} 16-\mathrm{H} 16 \cdots \pi$ and $\mathrm{C} 10-\mathrm{H} 10 \cdots \pi$ interactions with the centroid, CgP , of rings A and B (Figure 3, Table 3).

Figure 3. The packing diagram. The dashed lines show the $\mathrm{C}-\mathrm{H} \cdots \mathrm{N}$ and $\mathrm{C}-\mathrm{H} \cdots \pi$ (thiophene) contacts.
