#### Abstract

A series of new 4-(3,4dimethoxyphenethyl)-3,5-akyl/aryl-4H-1,2,4-triazoles (3a-g) were obtained by reaction of ethyl $\mathrm{N}^{\prime}$-(alkylidene/arylidene)hydrazonate (1) and 2-(3,4-dimethoxy phenyl)ethanamine (2). Compounds $\mathbf{4 d}$, $\mathbf{e}$, and $\mathbf{g}$ were synthesized from the reaction of corresponding compounds $\mathbf{3 d}$, $\mathbf{e}$, and $\mathbf{g}$ with $\mathrm{BBr}_{3}$, respectively. The 10 new compounds synthesized were characterized by elemental analyses, IR, ${ }^{1} \mathrm{H}$-NMR, and ${ }^{13} \mathrm{C}$-NMR spectral data. The structure of compound $\mathbf{3 g}$ was inferred through IR, ${ }^{1} \mathrm{H}$-, ${ }^{13}$ C-NMR, elemental analyses, and X-ray spectral techniques. In addition, the newly synthesized chemicals were screened for their antioxidant properties. Among the chemicals tested, 4d, e, and $\mathbf{g}$ exhibited the highest degree of antioxidant activity.

Key Words: Synthesis, 1,2,4-triazole, antioxidant activity, boron tribromide, X-ray

## Introduction

Triazole and its derivatives represent an important class of heterocycles. They are of biological importance and are used in the synthesis of drugs ${ }^{12}$ Triazole derivatives are also used in the synthesis of antibiotics, fungicides, herbicides, and plant growth hormone insulators and are potentially good corrosion inhibitions ${ }^{3-5}$ The incorporation of various substituents into the $1,2,4$-triazole ring and its fusion with various heterocyclic systems yield compounds with enhanced biological activities. The arrangement of 3 basic nitrogen atoms in the triazole ring induces the antiviral activities in the compounds containing this ring. ${ }^{6}$ The $1,2,4$-triazole nucleus has been incorporated into a wide variety of therapeutically interesting drug candidates including H1/H2 histamine receptor blockers, cholinesterase active agents, CNS stimulants, antianxiety and sedatives, ${ }^{7}$ and those

[^0]Synthesis, characterization, and antioxidant activities of..., K. SANCAK, et al.
with antimycotic activity such as fluconazole, itraconazole, and voriconazole. ${ }^{8,9}$ Moreover, there are some known drugs containing 1,2,4-triazole moiety, e.g., triazolam, alprazalam, etizolam, furacylin, and ribavirin. ${ }^{10-14}$ In the present study, prompted by these observations, the synthesis and antioxidant screening of new trisubstituted $1,2,4$-triazole derivatives and as hybrid molecules including different pharmacophores were examined.

## Experimental

## Materials and measurements

Ethyl N'-(alkylidene/arylidene)hydrazonate (1) was prepared according to procedures reported in the literature. ${ }^{15}$ All other chemicals were obtained from Merck or Sigma-Aldrich and used as supplied. ${ }^{1} \mathrm{H}-\mathrm{NMR}$ and ${ }^{13} \mathrm{C}-\mathrm{NMR}$ spectra were recorded on a Varian XL-200 NMR spectrophotometer in DMSO-d ${ }_{6}$. IR spectra were recorded on a Perkin-Elmer Spectrum one FT-IR spectrometer in KBr pellets. The MS spectra were measured with an Micromass Quattro LC/ULTIMA LC-MS/MS spectrometer with EtOH as solvent. The experiment was performed in the positive ion mode. Elemental analyses were performed on a Hewlett-Packard 185 CHN analyzer. Melting points were measured on an electrothermal apparatus and are uncorrected.

## General procedure for the preparation of compounds (3a-g)

4-(3,4-dimethoxyphenethyl)-3,5-alkyl/aryl-4H-1,2,4-triazole (3a-g): Ethyl N'-(alkylidene/arylidene) hydrazonate (1) ( 10 mmol ) together with 2-(3,4-dimethoxy phenyl)ethanamine (2) ( 10 mmol ) was heated without solvent in a sealed tube for 2 h at $130-140^{\circ} \mathrm{C}$. Then the mixture was cooled to r.t. and a solid formed. The crude product was recrystallized using ethyl acetate/petroleum ether (1:2) to afford the desired compound.

## 4-(3,4-dimethoxyphenethyl)-3,5-dimethyl-4H-1,2,4-triazole (3a)

Yield: $1.6 \mathrm{~g}(69 \%)$; colorless crystals, mp $154-157{ }^{\circ} \mathrm{C} . \mathrm{IR}\left(\mathrm{KBr}, \nu, \mathrm{cm}^{-1}\right): 1649(\mathrm{C}=\mathrm{N}), 1591(\mathrm{C}=\mathrm{C}), 1260$ (C-O-C); ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{DMSO}_{6}, \delta, \mathrm{ppm}\right): 2.08\left(\mathrm{~s}, 6 \mathrm{H}, \mathrm{CH}_{3}\right), 2.81\left(\mathrm{t}, 2 \mathrm{H}, \mathrm{Ar}-\mathrm{CH}_{2}\right), 3.67\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{OCH}_{3}\right), 3.70$ $\left(\mathrm{s}, 3 \mathrm{H}, \mathrm{OCH}_{3}\right), 4.02\left(\mathrm{t}, 2 \mathrm{H}, \mathrm{N}-\mathrm{CH}_{2}\right), 6.54-6.61\left(\mathrm{~m}, 2 \mathrm{H}\right.$, arom. General procedure for the preparation of compounds 4-(2,3-diaryl-4H-1,2,4-triazole-4-yl) ethyl)benzen-1,2-diol (4d, e, g): A solution of the 4-(3,4dimethoxyphenethyl)-3,5-alkyl/aryl-4H-1,2,4triazole ( $\mathbf{3 d}, \mathbf{3} \mathbf{e}, \mathbf{3 g}$ ) ( 10 mmol ) in chloroform $(100 \mathrm{~mL}$ ) was added to a solution of boron tribromide (10 $\mathrm{mmol})$ in chloroform $(200 \mathrm{~mL})$ at $0{ }^{\circ} \mathrm{C}$. The reaction mixture was then stirred under nitrogen atmosphere, at ambient temperature, for 1 h , and was poured into ice containing sufficient $50 \%$ sodium hydroxide to attain pH 10. Addition of concentrated sulfuric acid provided a precipitate, which was extracted into ether. The combined organic extract was washed with water and brine, and then dried and concentrated in vacuo to obtain compounds ( $\mathbf{4 d}, \mathbf{e}, \mathbf{g}$ ). The crude product was recrystallized using ethyl acetate/petroleum ether (1:4) to afford the desired compound (Scheme 1).

## Results and discussion

This paper has presented the synthesis of new trisubstituted triazole derivatives incorporating different pharmacophores as hybrid molecules possessing antioxidant activities (Scheme 1).

In the first part of this study, compounds $\mathbf{3 a - g}$ were synthesized via the reaction of compounds $\mathbf{1}$ with compound 2 (Scheme 1). Analytical and spectroscopic data of compounds $\mathbf{3}$ confirmed the success of the cyclization reaction. The IR data indicated the formation of compounds $\mathbf{3}$ by the disappearance of $\mathrm{C}=\mathrm{O}$ band and NH stretching frequency of compounds 1 about at $1700-1750 \mathrm{~cm}^{-1}$ and $3300 \mathrm{~cm}^{-1}$, respectively, and the appearance of a new band at $1604-1649 \mathrm{~cm}^{-1}$ belonging to $\mathrm{C}=\mathrm{N}$ of the $1,2,4$-triazole ring. In the ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectrum of compounds $\mathbf{3}$, the existence of $\mathbf{3}$ was revealed by the disappearance of the chemical shifts belonging to $\mathrm{O}-\mathrm{C}_{2} \mathrm{H}_{5}$ and NH protons ( $\delta=9.15-11.59 \mathrm{ppm}$ ) in the precursor $\mathbf{1}$ after the cyclization and the appearance of a new peak at $\delta=3.66-3.69 \mathrm{ppm}$ belonging to $\mathrm{O}-\mathrm{CH}_{3}$ protons. ${ }^{13} \mathrm{C}-\mathrm{NMR}$, elemental analyses, and mass spectral data were also in agreement with the proposed structure.

The synthesis of 4-(2,3-diaryl-4 H-1,2,4-triazole-4-yl)ethyl)benzen-1,2-diol ( $4 \mathbf{d}, \mathbf{e}, \mathbf{g}$ ) was performed by the reaction of compounds $\mathbf{3}$ with $\mathrm{BBr}_{3}$ at the reflux temperature in the presence of chloroform (Scheme 1).

## Antioxidant activity

DPPH assay: T Radical scavenging activity of synthesized compounds against stable free radical 2,2-diphenyl-2-picrylhydrazyl hydrate (DPPH, Sigma-Aldrich Chemie, Steinheim, Germany) was determined spectrophotometrically. When DPPH reacts with an antioxidant compound, which can donate hydrogen, it is reduced. Following the reduction, its deep violet color in methanol bleaches to yellow, showing a significant absorption decrease at 517 nm . Fifty milliliters of various concentrations of the compounds dissolved in methanol was added to 5 mL of a $0.004 \%$ methanol solution of DPPH. After a 30 min incubation period at room temperature, the absorbance was read against a blank at 517 nm (ATI-Unicam UV-2 UV-Vis spectrophotometer, Cambridge, UK). Free radical DPPH inhibition as a percentage (I\%) was calculated as follows:
$\mathrm{I} \%=\left(\mathrm{A}_{\text {blank }}-\mathrm{A}_{\text {sample }} / \mathrm{A}_{\text {blank }}\right) \times 100$, where $\mathrm{A}_{\text {blank }}$ is the absorbance of the control reaction (containing all reagents except the test compound), and $\mathrm{A}_{\text {sample }}$ is the absorbance of the test compound. Compounds' concentration providing $50 \%$ inhibition (IC50) was calculated from the graph plotted as inhibition percentage against compound concentration (Figures 1 and 2). Tests were carried out in triplicate, and butylated hydroxytoluene (BHT) was used as a positive control. ${ }^{16}$

## Crystal structure determination of 3 g

## Data collection

A block single crystal with dimensions $0.570 \times 0.357 \times 0.110 \mathrm{~mm}$ was mounted on a goniometer and data collection was performed on a STOE IPDS $I^{17}$ diffractometer by the $\omega$ scan technique using graphitemonochromatic $M o K_{\alpha}$ radiation $(\lambda=0.71073 \AA)$ at 296 K . The intensity symmetries indicate the triclinic $C 2 / c$ space group. A total of 20,262 reflections ( 5759 unique) were performed within $2 \theta$ range $1.45^{\circ}$ and $28.50^{\circ}$.

Correction for absorption $(\mu=0.086)$, by comparison of the intensities of equivalent reflections, was applied using X-RED software and cell parameters were determined by using X-AREA software. ${ }^{17}$ The initial partial solution obtained by direct methods as implemented in the program SHELXS-97 was expanded and refined by means of the program SHELXL-97. ${ }^{18}$ The program ORTEP-3 for Windows was used in the preparation of the figure. ${ }^{19}$ All non-hydrogen atoms were refined anisotropically. The refinement carried out by full matrix least squares method on the positional and anisotropic temperature parameters of non-hydrogen atoms corresponding to 297 crystallographic parameters. All H atoms were included in calculated positions and refined using a riding model. The structure was refined to $R_{i n t}=0.0591$ with 2856 observed reflections by the condition of $I>2 \sigma(I)$ threshold. The absorption correction was applied with integration type $\left(T_{\min }=0.9573\right.$ and $\left.T_{\max }=0.9889\right)$.

## Results and riscussion

The crystallized structure of compound $\mathbf{3 g}\left(\mathrm{C}_{25} \mathrm{H}_{27} \mathrm{~N}_{3} \mathrm{O}_{4}\right)$ is in the monoclinic space group $\mathrm{C} 2 / \mathrm{c}$ with $\mathrm{Z}=$ 8 in the unit cell (Table 1, Figure 3). In the molecule of compound $\mathbf{3 g}, \mathrm{C}_{25} \mathrm{H}_{27} \mathrm{~N}_{3} \mathrm{O}_{4}$, contains the 1,2,4triazole ring and the aromatic ring groups are bridged by triazole moiety. The whole molecule is not planar but each ring system is planar individually. The triazole ring is oriented with respect to the 5 -benzyl and 3,4-dimethoxyphenethyl rings at dihedral angles of $86.74(1)^{\circ}$ and $7.44(1)^{\circ}$, respectively, which shows that triazole and benzyl rings are almost perpendicular to each other. The triazole ring system is almost planar with the maximum deviation of $-0.003(2) \AA$ for atom C 8 . In the molecule of compound $\mathbf{3 g}$, the bond lengths

Synthesis, characterization, and antioxidant activities of..., K. SANCAK, et al.
and angles are within normal ranges and they are comparable with those of the related structure. ${ }^{20}$ Compound $3 \mathrm{~g}, \mathrm{C}_{25} \mathrm{H}_{27} \mathrm{~N}_{3} \mathrm{O}_{4}$, containing the triazole ring, displays the characteristic features of 1,2,4-triazole derivatives. From analysis of the values therein, it can be concluded that for the structure $\mathrm{N} 1=\mathrm{C} 8$ and $\mathrm{N} 2=\mathrm{C} 9$ are well defined double bonds, and are the shortest bonds in the heterocycle ring. The torsion angle \{(N3-C16-C17-C18) is $161.65(16)^{\circ}$ \} shows that for compound $\mathbf{3 g}$ the side chain conformation is induced by the anti-conformation.

Structurally, compound $\mathbf{3 g}$ forms C-H... O and O-H... N type intermolecular hydrogen bonds and an O$\mathrm{H} . . . \mathrm{O}$ type intramolecular hydrogen bond. The intermolecular contacts are $\mathrm{C} 24-\mathrm{H} 24 \mathrm{~A} \ldots \mathrm{O} 3^{i}, \mathrm{O} 4-\mathrm{H} 33 \ldots \mathrm{~N} 1^{i i}$ and $\mathrm{O} 4-\mathrm{H} 22 \ldots \mathrm{~N} 2^{i i i}$ where the H atoms of the water molecule are engaged in hydrogen bonding with N 1 and N 2 atoms of the triazole system [symmetry codes: (i) $-\mathrm{x}+3 / 2,-\mathrm{y}+1 / 2,-\mathrm{z}+1$; (ii) $\mathrm{x}+1 / 2,-\mathrm{y}+1 / 2$, $\mathrm{z}+1 / 2$; (iii) $-\mathrm{x}+2, \mathrm{y},-\mathrm{z}+1 / 2]$. There is also an intramolecular contact, namely O1-H1...O4. C-H... $\pi$ interaction is present in compound $\mathbf{3 g}$, between the benzene ring and the C 17 atom [C17-H17A... Cg (2), Cg (2) is $\mathrm{C} 1 / \mathrm{C} 2 / \mathrm{C} 3 / \mathrm{C} 4 / \mathrm{C} 5 / \mathrm{C} 6$ with symmetry code: $\mathrm{x}, \mathrm{y}, \mathrm{z}$; the details of the bonds are given in hydrogen bonding Table 2.

## Conclusions

New trisubstituted 1,2,4-triazole derivatives were synthesized and characterized based on elemental analysis, ${ }^{1} \mathrm{H}-$ and ${ }^{13} \mathrm{C}$-NMR spectra, mass spectra, and IR. In addition, compound $\mathbf{3 g}$ was characterized by combination of X-ray crystallography and theoretical methods. The crystal structure of the compound $\mathbf{3 g}$ is stabilized by C-H. . . O and O-H. . . N type intermolecular hydrogen bonds and O-H... O type intramolecular hydrogen bond.

To support the solid state structure, the geometric parameters and single crystal X-ray diffraction technique were used. Good correlation was found between the experimental and computed values. Furthermore, the antioxidant activities of compounds $\mathbf{4 d}, \mathbf{e}$, and $\mathbf{g}$ were evaluated. Strong scavenging effects of compounds $\mathbf{4 d}$, $\mathbf{4 e}$, and $\mathbf{4 g}$ were noted on the level of DPPH radical. These results show that in vitro the newly synthesized 4-(2,3-diaryl-4 H-1,2,4-triazole-4-yl)ethyl)benzen-1,2-diols (4d, e, g) possess highly potent antioxidant properties.

## Acknowledgments
